

Euro House Service Connect [EHSC]

Rehabilitation of the house connection - From the streetside sewer

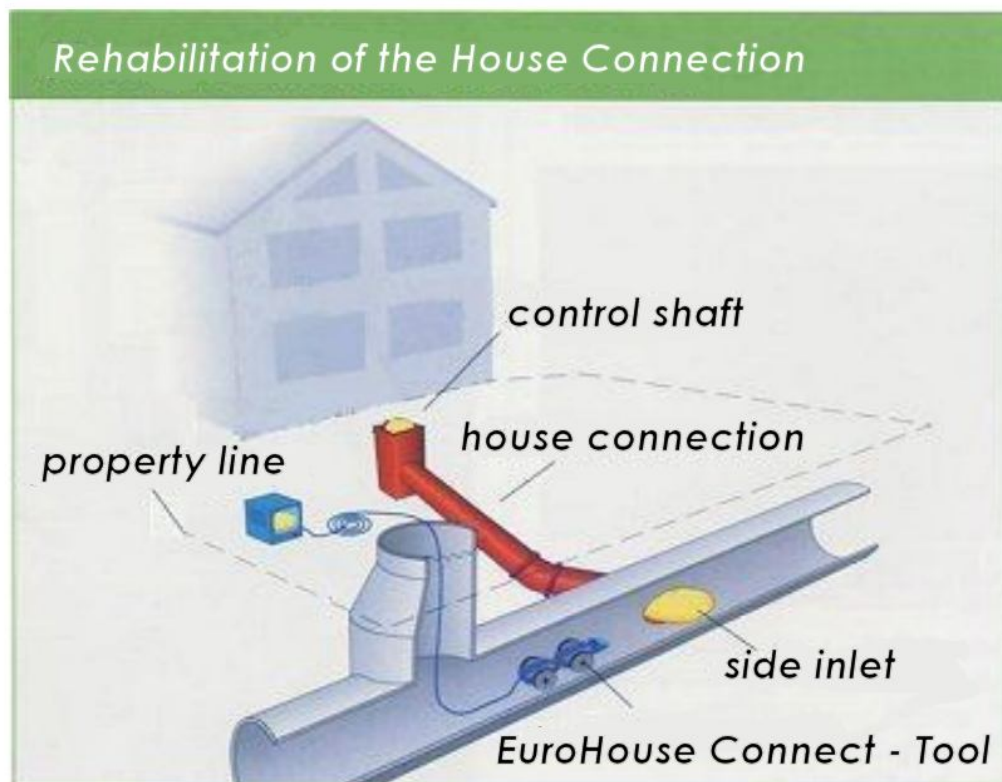

According to the latest environmental insights is the tightness of the house connections of increasing importance.

With conventional methods, the house connects can be rehabilitated just from the property of the homeowner. So far, it is necessary for completing the rehabilitation to ask the property owners for access to the control shaft. This is complicated, often the control shafts are not available. With our new development all preliminary remediation work are made possible through the main sewer from street-side without entering the property of the homeowner!

With our method all made possible from streetside through the main sewer:

- 1) The residue-free removal of roots and debris by the high pressure rinsing
- 2) Robots are too slow and too expensive for this work
- 3) Dissolved residues are flushed out over pulley return
- 4) With our patented method the liner is now inverted
- 5) Side inlets are now opened with micro-robots, then the TV inspection and documentation is possible

→ all preliminary remediation work made possible through the main sewer from street-side!

Advantage for local authorities:

All sewer which are in the responsibility of the community such as street-inlets and proportionate land drainage can be rehabilitated without consultation with the homeowner.

Advantage municipality / Private Client:

In consultation between local authorities and homeowners measures can be extended. The homeowners may apply to the measures necessary for their own house connections.

The Euro House Service Connect is a new (since 2010!) method, unique in the world, a patented tooling system, can be used universally and with decisive competitive advantage!
